

How to Update the Al-Andalus Website

Simple guide for uploading a new website update on cPanel.

Step 1 — Open the website folder

In cPanel, open File Manager.

Go to this folder:

alandalus-iq.com / nodejs

Step 2 — Backup the old build

Inside the nodejs folder, find the folder named:

.next

Rename it to:

.next-backup

This keeps a safe copy in case something goes wrong.

Step 3 — Upload the new update

Upload the file cpanel-deploy.zip into the nodejs folder.

Then extract (unzip) it inside the same nodejs folder.

Step 4 — Fix permissions

Open Terminal in cPanel and run these commands one by one:

```
cd ~/alandalus-iq.com/nodejs
```

```
chmod -R u+rwX,go+rX .next
```

Step 5 — Restart the website

In cPanel, open Setup Node.js App.

Click Restart for the Al-Andalus website app.

Step 6 — Check the website

Open:

- <https://alandalus-iq.com>
- <https://alandalus-iq.com/admin> (important: do not use www)

Hard refresh the page: Ctrl + F5

Important rules

- Never upload or replace the database file.
- Never set PAYLOAD_DATABASE_PUSH to true unless the developer asks you to.
- Always use <https://alandalus-iq.com/admin> (not www) for the dashboard.
- You usually do not need to run NPM Install. Only run it if the developer says so.

Need help? Contact your developer and send a screenshot of any error.
